Three steps to grasp both C++ Syntax and Semantics - Fast!

Actively speed read: tutorials
and source code repositories

Implement:
trial projects

Review:
what you've accomplished

```
private static $host;  
private static $username;  
private static $password;  
private static $database;  
private static $charset;  
  
static private $link = null;  
  
public static function Connect(  
    self::$link = mysql_connect(  
        self::$host, self::$  
        self::$username, self::$  
        self::$password, self::$  
        self::$charset  
    )  
)  
{  
    if (!$link) {  
        throw new MySQLException("Cannot connect to  
        MySQL. Check your host name and  
        credentials.  
    }  
    self::$link = $link;  
}
```

SAMUEL GINN
COLLEGE OF ENGINEERING

C++ Origins

- Low-level languages
 - Machine, assembly
- High-level languages
 - C, C++, ADA, COBOL, FORTRAN
- Object-Oriented-Programming in C++

Prepare Your Development Environment:

Three Candidate Environments

Linux Environment:
No IDE: vi, g++, gdb

Windows Environment:
Eclips IDE, MinGW or Cygwin

Mac OS Environment:
xCode IDE, Clang C++ compiler

Computers

Computer Labs:
Windows PC and Mac

Your Laptop:
Windows, Linux, and
Mac OS

What you need on your Windows for Linux Programming

Terminal: (Mac/Linux)

- Mac
 - Boot your computer -> click a “search” icon on the top right corner -> type “terminal” -> click “Enter”
- Linux
 - Boot your computer -> click a “search” icon on the top/bottom left corner -> type “terminal” -> click “Enter”
- Please type “terminal”

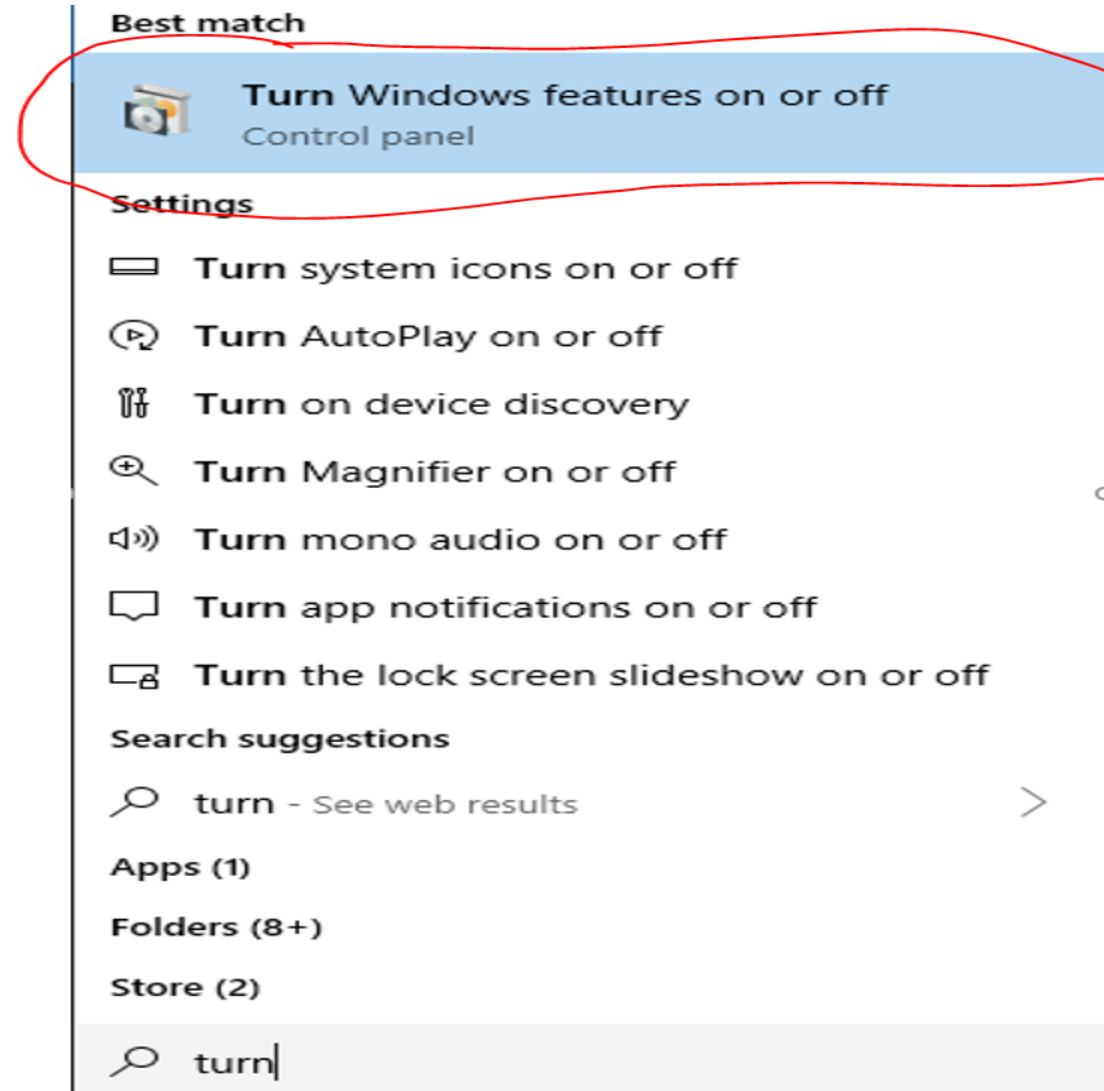

Terminal: (Windows)

- Option1: Boot your computer -> press Win+S -> type “cmd” -> click “Enter”
- Option2: Boot your computer -> press Win+S -> type “Window PowerShell” -> click “Enter”

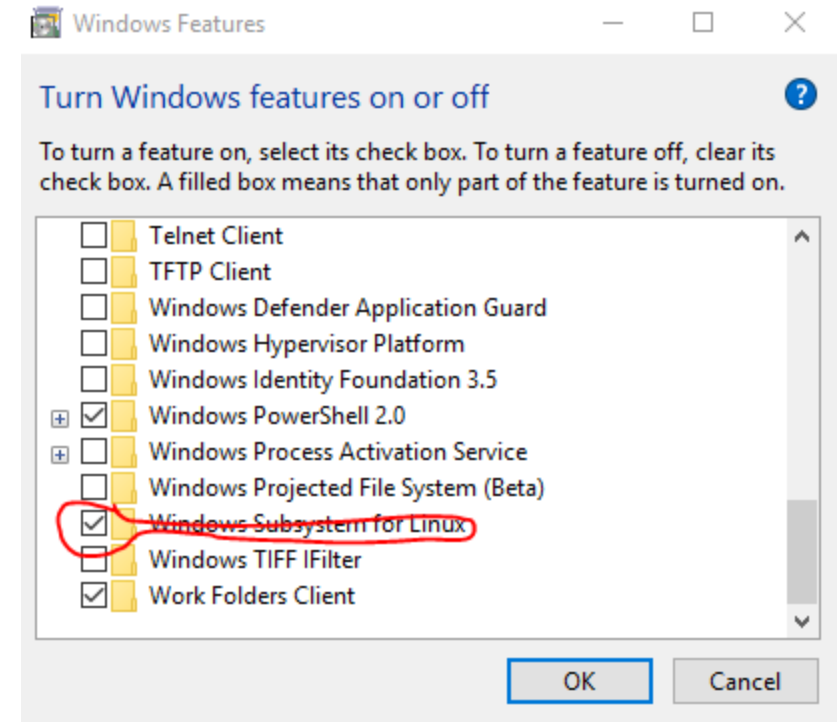

Terminal: (WinSub)

- Option3
1. Under a search bar, type “Turn Windows feature on or off” and enter it.

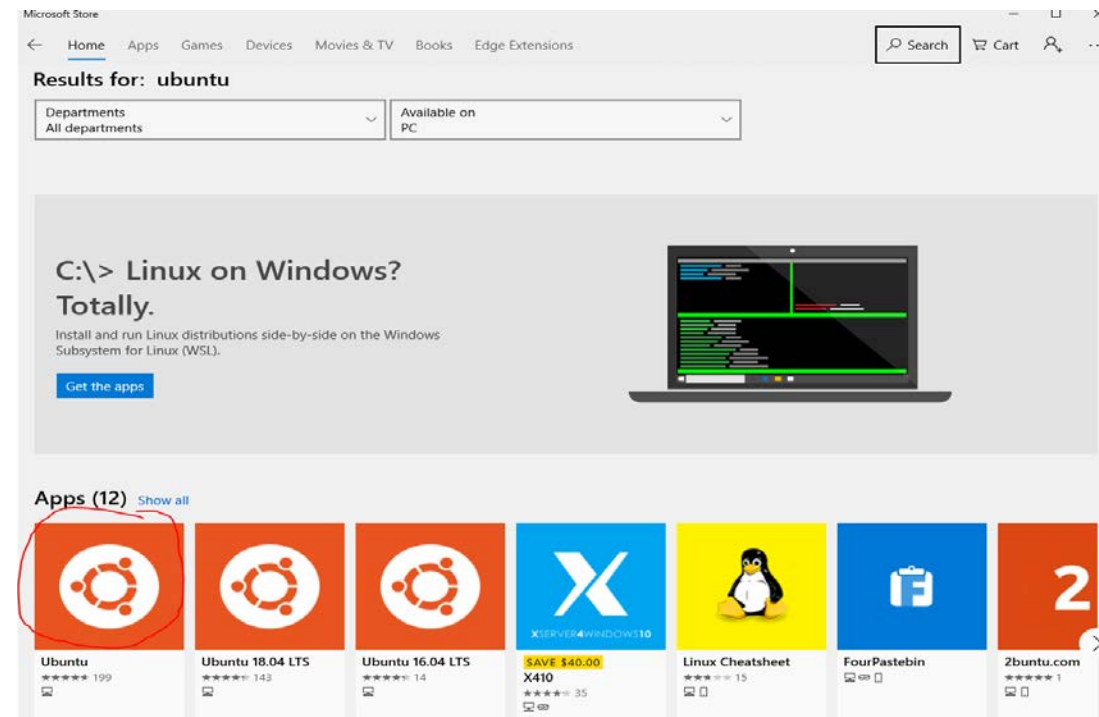

Terminal: (WinSub)

- Option3
2. Please check the box of “Windows subsystem for Linux” and click OK.

Terminal: (WinSub)

- Option3
- ## 3. Launch “Window store”.

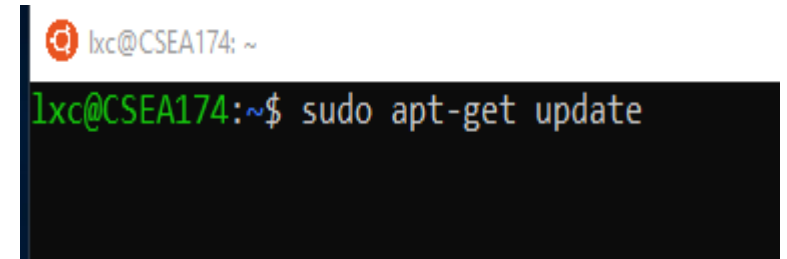

Terminal: (WinSub)

- Option3
4. Click a “start” button and launch your “Ubuntu”.

Terminal: (WinSub)

- Option3
5. On your “Terminal”, please type
“sudo apt-get install update” to get
a latest version.

A screenshot of a terminal window with a black background. The prompt 'lxc@CSEA174: ~' is shown in green text. Below it, the command 'sudo apt-get update' is entered in white text.

```
lxc@CSEA174: ~  
lxc@CSEA174:~$ sudo apt-get update
```

Login

- In your “Terminal”, type “ssh AUusername@gate.eng.auburn.edu” -> click “Enter”.
- You will receive the following info:
AUusername@gate.eng.auburn.edu’s password:->type your AU password -> click “Enter”
- You will receive a “Welcome” info and require you to select a proper machine. Leave it blank and click “Enter”

Login

Welcome to Ubuntu 14.04.5 LTS (GNU/Linux 3.13.0-164-generic x86_64)

* Documentation: <https://help.ubuntu.com/>

New release '16.04.5 LTS' available.

Run 'do-release-upgrade' to upgrade to it.

Last login: Thu Jan 10 19:30:49 2019 from csea174.eng.auburn.edu

.....

.....

Please enter the name of an Engineering host <anywhere>:

Permission

1. pwd
2. cd ../
3. chmod go-rwx yourAUAaccount
 - ✓ g-group
 - ✓ o-other
 - ✓ r-read
 - ✓ w-write
 - ✓ x-execute
 - ✓ d-directory

Vi

- Vi is a feature rich editor located on almost all Unix/Linux machines around. Once learned, **editing files is extremely fast.**
- The downside:
 - It's more complicated than Pico.
 - It takes time to learn how to use vi.
 - It's easy to mess up your documents when you are first learning vi.

Vi and Bike

Photo Courtesy of [David and Kelly Godzwa](#)

Once you learned it, you don't want to walk anymore ...

Photo Courtesy of [Daniel Moyer Photography](#)

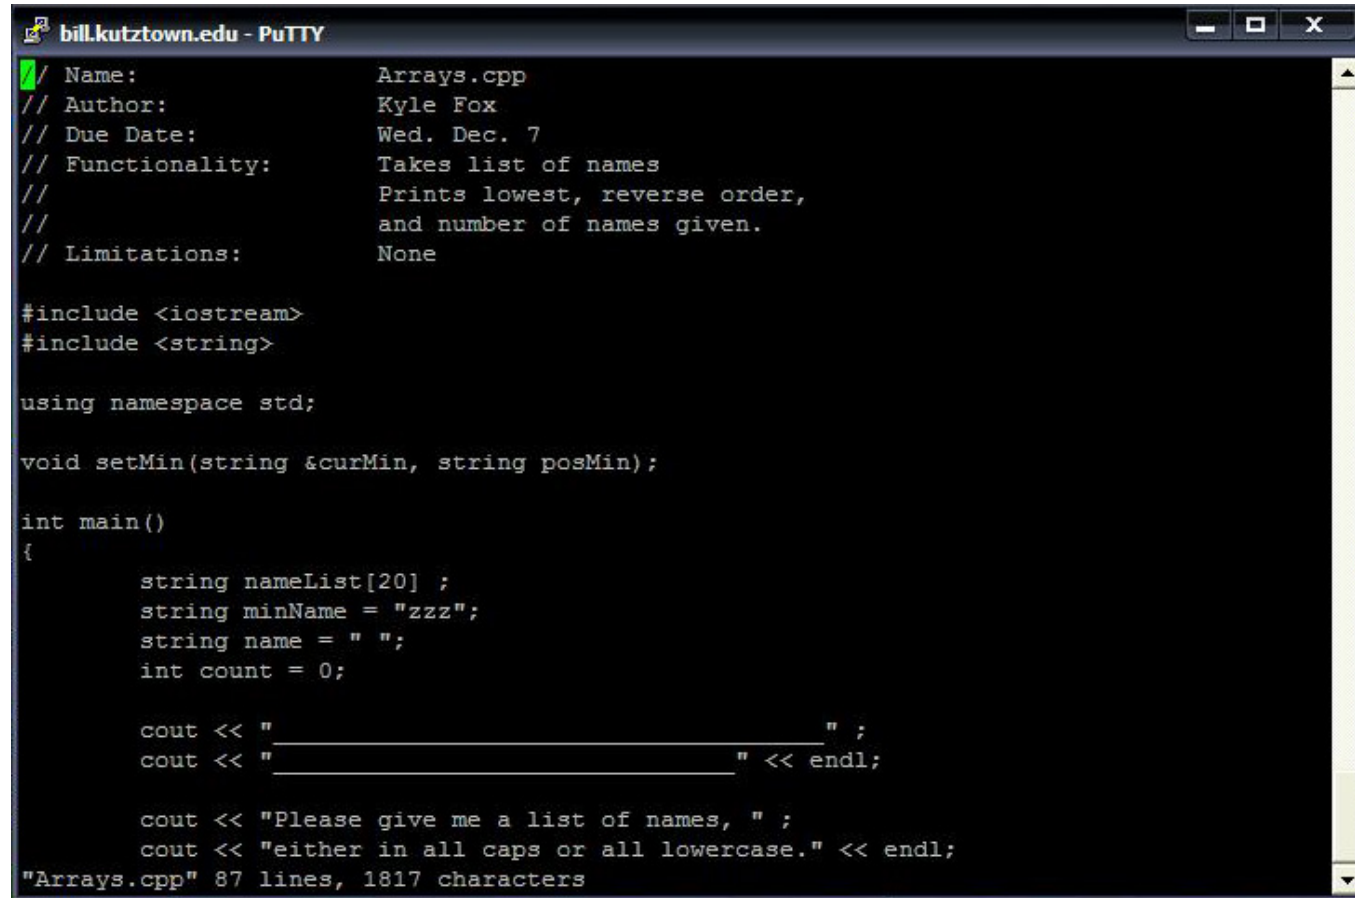

Vi Basics (1)

- There are three modes to vi:
 - Command mode (you start in this mode)
 - It is used for entering commands
 - The escape key always gets you back to command
 - Insert/Append mode
 - It is used for inserting or appending text
 - From command mode, “a” will get you append mode, and “i” will get you insert mode.
 - Line mode
 - The “:” from command will get you to line mode.
 - It is used for controls like saving and exiting.

Vi Basics (2)

- Open a file using “*vi the_file*”.
- Save using “w” (write) from line mode.
- Quit using “q” (quit) from line mode.
- Combine the two to save and quit “wq”.
- Go to line using “#a_number” from line mode.
- Delete a character using “x” from control mode.
- Delete a line using “dd” from control mode.

Vi Image

```
bill.kutztown.edu - PuTTY
// Name:          Arrays.cpp
// Author:         Kyle Fox
// Due Date:       Wed. Dec. 7
// Functionality:   Takes list of names
//                 Prints lowest, reverse order,
//                 and number of names given.
// Limitations:     None

#include <iostream>
#include <string>

using namespace std;

void setMin(string &curMin, string posMin);

int main()
{
    string nameList[20] ;
    string minName = "zzz";
    string name = " ";
    int count = 0;

    cout << "_____";
    cout << "_____ " << endl;

    cout << "Please give me a list of names, " ;
    cout << "either in all caps or all lowercase." << endl;
"Arrays.cpp" 87 lines, 1817 characters
```

Compiling a C++ Program

- To compile a c++ program, use the g++ command. “*g++ helloworld.cpp*”
 - Provided there are no errors, this will create an executable file called *a.out*.
 - If you want to name your executable file, use the -o flag to specify a name. “*g++ helloworld.cpp -o helloworld.out*”

Running a C++ Program

- Running a c++ program is easy, just type in the **name of the executable file!**
 - “*a.out*”
- There could be a minor issue however. If for some reason, that doesn't work, try preceding the name with a **./**
 - “*./a.out*”

Core Files

- If for some reason, you have a very bad error happen when you run your program, you may end up with a **core dump**.
- What happens is that Unix saves all information about what happened to a file named “**core**”.
- Make sure if this happens to you, that you remove the core file, because they are big, and can take up a lot of your space!

Download/Upload

- Syntax: `scp [location of source files] [destination]`
i.e. Mac/Linux

scp xzl0031@scp.eng.auburn.edu:/home/cse_h1/xzl0031/helloworld.cpp ./

Windows:

scp /mnt/c/Users/xzl0031/Desktop/test.cpp xzl0031@scp.eng.auburn.edu:/home/cse_h1/xzl0031

.tar.gz (multiple files)

- Syntax: `tar -zcvf favorite_name.tar.gz /folder/directory`
- i.e. `tar -zcvf Quiz1_xzl0031.tar.gz /home/cse_h1/xzl0031/COMP2710/Quiz1`
